## **Section 1**

### ***Initial Setup***

*This section provides an overview of the setup procedures for the unit.*

## 1.1 Setup

### 1.1.1 Factory Defaults

Many of the settings for this unit have been configured before the unit ships.

Where possible, these settings are configured with the optimum or most common values for the setting. For example, the port number of the SIP (Session Initiation Protocol) server is set to "5060".

However, many of the settings, such as the address of the SIP server or the phone number, have not been pre-configured, and they must be modified depending on the usage environment. If the port number of the SIP server is not "5060", the value of this setting must be changed.

This unit thus will not function properly using only the factory default settings. The settings for each feature must be configured according to the environment in which the unit is used.

#### Note

- If you are using a PoE hub, the number of devices that you can connect simultaneously is limited by the amount of power supplied by the hub.

### 1.1.2 Language Selection for the Unit

You can change the language used on the LCD.

In addition, various settings can be configured by accessing the Web user interface from a PC on the same network (→ see **4 Web User Interface Programming**). You can select the language for the Web user interface.

#### Note

- To select the display language for the unit, refer to the Operating Instructions on the Panasonic Web site (→ see **Introduction**).
- To select the display language for the Web user interface, see **4.4.1 Language Settings**.

### 1.1.3 Basic Network Setup

This section describes the basic network settings that you must configure before you can use the unit on your network.

You must configure the following network settings:

- IP Address Mode (IPv4 or IPv6 or IPv4/IPv6 Dual) settings
- TCP/IP settings (DHCP / RA for IPv6 / static IP)
- DNS server settings

For details about basic network settings via the Web user interface, see **4.3.1 Basic Network Settings**.

#### TCP/IP Settings for IPv4 (DHCP or Static IP Address Assignment)

A unique IP address must be assigned to the unit so that it can communicate on the network. How you assign an IP address depends on your network environment. This unit supports the following 2 methods for assigning an IP address:

##### Obtaining an IP Address Automatically from a DHCP Server

You can configure the unit to automatically obtain its IP address when it starts up from a DHCP server running on your network. With this method, the system can efficiently manage a limited number of IP addresses. Note that the IP address assigned to the unit may vary every time the unit is started up.

For details about the DHCP server, consult your network administrator.

## Using a Static IP Address Specified by Your Network Administrator

If IP addresses for network devices are specified individually by your network administrator, you will need to manually configure settings such as the IP address, subnet mask, default gateway, and DNS servers. For details about the required network settings, consult your network administrator.

### TCP/IP Settings for IPv6 (DHCP, RA or Static IP Address Assignment)

A unique IP address must be assigned to the unit so that it can communicate on the network. How you assign an IP address depends on your network environment. This unit supports the following 3 methods for assigning an IP address:

#### Obtaining an IP Address Automatically from a DHCP Server

You can configure the unit to automatically obtain its IP address when it starts up from a DHCP server running on your network. With this method, the system can efficiently manage a limited number of IP addresses. Note that the IP address assigned to the unit may vary every time the unit is started up. For details about the DHCP server, consult your network administrator.

#### Using a Static IP Address Specified by Your Network Administrator

If IP addresses for network devices are specified individually by your network administrator, you will need to manually configure settings such as the IP address, Prefix, default gateway, and DNS servers. For details about the required network settings, consult your network administrator.

#### Using a RA (Router Advertisement)

An IPv6 address can be assigned using Stateless Autoconfiguration. This enables the setting of addresses for only the router and the node without the need to manage information. For details about the required network settings, consult your network administrator.

## DNS Server Settings

You can configure the unit to use 2 DNS servers: a primary DNS server is DNS1 and a secondary DNS server is DNS2. The primary DNS1 server receives priority over the secondary DNS2 server. If the primary DNS1 server returns no reply, the secondary DNS2 server will be used.

For details about configuring the DNS server settings using the unit, or using the Web user interface, see **Configuring the Network Settings of the Unit** in this section.

#### DNS Priority Using Configuration File

The setting for DNS server(s) may be configured using the configuration files by your phone system dealer/service provider (→ see "DHCP\_DNS\_ENABLE", "DHCP\_DNS\_ENABLE\_IPV6", "USER\_DNS1\_ADDR"/"USER\_DNS2\_ADDR" (for IPv4) and "USER\_DNS1\_ADDR\_IPV6"/"USER\_DNS2\_ADDR\_IPV6" (for IPv6) in **5.3.2 Basic Network Settings**).

- When "DHCP\_DNS\_ENABLE" (for IPv4) is set to "Y", you can manually configure the DNS server address by using "USER\_DNS1\_ADDR" or ("USER\_DNS1\_ADDR" and "USER\_DNS2\_ADDR"). When set to "N", the DNS server address will be automatically transmitted. This setting is available only when ("IP\_ADDR\_MODE"="0" or "IP\_ADDR\_MODE"="2") and "CONNECTION\_TYPE"="1".
- When "DHCP\_DNS\_ENABLE\_IPV6" (for IPv6) is set to "Y", you can manually configure the DNS server address by using "USER\_DNS1\_ADDR\_IPV6" or ("USER\_DNS1\_ADDR\_IPV6" and "USER\_DNS2\_ADDR\_IPV6"). When set to "N", the DNS server address will be automatically transmitted. This setting is available only when ("IP\_ADDR\_MODE"="1" or "IP\_ADDR\_MODE"="2") and "CONNECTION\_TYPE\_IPV6"="1".

## 1.1.4 Overview of Programming

There are 3 types of programming, as shown in the table below:

## 1.1.5 Phone User Interface Programming

---

Programming Type	Description	References
Phone user interface programming	Configuring the unit's settings directly from the unit.	→ 1.1.5 Phone User Interface Programming → 3 Phone User Interface Programming
Web user interface programming	Configuring the unit's settings by accessing the Web user interface from a PC connected to the same network.	→ 1.1.6 Web User Interface Programming → 4 Web User Interface Programming
Configuration file programming	Configuring the unit's settings beforehand by creating configuration files (pre-provisioning), and having the unit download the files from a server on the Internet and configure its own settings (provisioning).	→ 2 General Information on Provisioning → 5 Configuration File Programming

## 1.1.5 Phone User Interface Programming

You can change the settings directly from the unit.

For details about the operations, refer to the Operating Instructions on the Panasonic Web site (→ see **Introduction**).

For details about additional features available with direct commands, see **3 Phone User Interface Programming**.

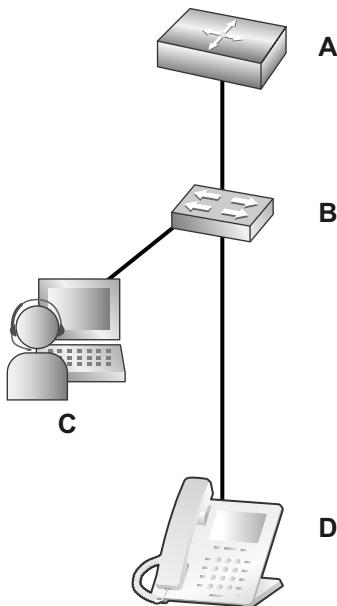

### 1.1.5.1 Changing the Language for Phone User Interface Programming

You can change the language used on the LCD. Because the language settings for the LCD of the unit are not synchronized, you must set the languages individually for the unit.

For details about changing the setting, refer to the Operating Instructions on the Panasonic Web site (→ see **Introduction**).

## 1.1.6 Web User Interface Programming

After connecting the unit to your network, you can configure the unit's settings by accessing the Web user interface from a PC connected to the same network. For details, see **4 Web User Interface Programming**.

- A. Router
- B. Switching Hub
- C. PC
- D. SIP Phone

### 1.1.6.1 Password for Web User Interface Programming

To program the unit via the Web user interface, a login account is required. There are 2 types of accounts, and each has different access privileges.

- **User:** User accounts are for use by end users. Users can change the settings that are specific to the unit.
- **Administrator:** Administrator accounts are for use by administrators to manage the system configuration. Administrators can change all the settings, including the network settings, in addition to the settings that can be changed from a User account.

A separate password is assigned to each account.

For details, see **Access Levels (IDs and Passwords)** in **1.1.6.3 Before Accessing the Web User Interface**.

#### Notice

- You should manage the passwords carefully, and change them regularly.

### 1.1.6.2 Changing the Language for Web User Interface Programming

When accessing the unit via the Web user interface on a PC connected to the same network, various menus and settings are displayed. You can change the language used for displaying these setting items. Because the language setting for the Web user interface is not synchronized with those of the unit, you must set the languages for each independently.

For details, see **4.4.1 Language Settings**.

## Configuring Settings from the Web User Interface

### To close the unit's Web port

1. In the Web user interface, click [Web Port Close].
2. Click OK.

### Note

- The Web port of the unit will be closed automatically in the following conditions:
  - 3 consecutive unsuccessful login attempts occur.
- The Web port can be set to stay open continuously, through Configuration file programming (→ see "`HTTPD_PORTOPEN_AUTO`" in **5.3.8 HTTPD/WEB Settings**). However, please recognize the possibility of unauthorized access to the unit by doing so.

## Access Levels (IDs and Passwords)

2 accounts with different access privileges are provided for accessing the Web user interface: User and Administrator. Each account has its own ID and password, which are required to log in to the Web user interface.

Account	Target User	ID (default)	Password (default)	Password Restrictions
User	End users	user	-blank-(NULL)	<ul style="list-style-type: none"> <li>• When logged in as User, you can change the password for the User account (→ see <b>4.4.2 User Password Settings</b>).</li> <li>• The password can consist of 6 to 64 ASCII characters (case-sensitive) (→ see <b>Entering Characters</b> in <b>1.1.6.4 Accessing the Web User Interface</b>).</li> </ul>
Administrator	Network administrators, etc.	admin	adminpass	<ul style="list-style-type: none"> <li>• When logged in as Administrator, you can change the password for both the User and Administrator accounts (→ see <b>4.4.3 Admin Password Settings</b>).</li> <li>• The password can consist of 6 to 64 ASCII characters (case-sensitive) (→ see <b>Entering Characters</b> in <b>1.1.6.4 Accessing the Web User Interface</b>).</li> </ul>

### Notice

- Only one account can be logged in to the Web user interface at a time. If you try to access the Web user interface while someone is logged in, you will be denied access.
- You cannot log in to the Web user interface even under the same account as someone who is already logged in.
- The user password is required to change the settings.
- The IDs can be changed through configuration file programming (→ see "`ADMIN_ID`" and "`USER_ID`" in **5.3.8 HTTPD/WEB Settings**).
- If you forget your account IDs or passwords, consult your phone system dealer/service provider.

### 1.1.6.4 Accessing the Web User Interface

The unit can be configured from the Web user interface.

#### To access the Web user interface

1. Open your Web browser, and then enter "http://" followed by the unit's IP address into the address field of your browser.
  - a. When the IP address is 192.168.0.1 (IPv4), access the following URL.  
http://192.168.0.1/
  - b. When the IP address is 2001:db8:1f70::999:de8:7648:6e8 (IPv6), access the following URL. With IPv6, the IP address is enclosed in square brackets ("[" and "]").  
http://[2001:db8:1f70::999:de8:7648:6e8]/

    3. Tap "**Status**".
    4. Tap **▲** or **▼** to select "**IPv4 Settings**"/"**IPv6 Settings**".
    5. Tap "**IP Address**". (IPv6 only)
2. For authentication, enter your ID (username) and password, and then click **OK**.

#### Notice

- The default ID for the User account is "user", and the default password is blank. The ID cannot be changed from the Web user interface, but it can be changed through configuration file programming.
  - When you log in as User to the Web user interface for the first time, the [**User Password Settings**] screen (→ see **4.4.2 User Password Settings**) will be displayed. Enter a new password, and then perform authentication again with the new password to log in to the Web user interface.
  - The default ID for the Administrator account is "admin", and the default password is "adminpass". The ID cannot be changed from the Web user interface, but it can be changed through configuration file programming.
3. The Web user interface window is displayed. Configure the settings for the unit as desired.
  4. You can log out from the Web user interface at any time by clicking [**Web Port Close**].

## **Section 2**

### ***General Information on Provisioning***

*This section provides an overview of the configuration file programming procedures for the unit, including pre-provisioning and provisioning.*

## 2.1 Pre-provisioning

### 2.1.1 What is Pre-provisioning?

Pre-provisioning is an auto-provisioning mechanism that automatically obtains the server address saved in the configuration file administered by the carrier or distributor.

There are two methods for automatically obtaining the server address saved in the configuration file.

1. SIP PnP

The phone multicasts a SIP SUBSCRIBE message and obtains a provisioning server address via a SIP NOTIFY message.

2. DHCP options

The phone obtains a provisioning server address via the DHCP option information. DHCP options 66, 159 and 160 will be used when the phone's IP address mode is IPv4, and DHCP option 17 will be used when the phone's IP address mode is IPv6.

### 2.1.2 How to Obtain a Pre-provisioning Server Address

Upon startup, the phone will attempt to obtain a pre-provisioning server address as follows.

1. When the phone's IP address mode is IPv4

The phone will attempt to obtain a pre-provisioning server address using SIP PnP, but when it cannot, it will attempt to do so from DHCPv4 options.

2. When the phone's IP address mode is IPv6

The phone will attempt to obtain a pre-provisioning server address from DHCPv6 options.

3. When the phone's IP address mode is IPv4/v6 Dual

The phone will attempt to obtain a pre-provisioning server address using SIP PnP, but when it cannot, it will attempt to do so from DHCPv4 options. When this is not possible, it will attempt to do so from DHCPv6 options.

#### Note

- The SIP PnP function is enabled in the initial state. It can be enabled or disabled from the configuration parameter "SIPPNP\_PROV\_ENABLE".

### 2.1.3 Server Address Formats

1. Basic format

Format: <scheme>://<user>:<password>@<host>:<port>/<url-path>/<file name>

\* The server name (<host>) may be the IP address or the domain.

\* Maximum length: 384 characters

2. Macros used with file names

Macro Format {XXXX}	Macro Expansion
{MAC}	If the URL contains {MAC}, it will be replaced with the device's MAC address in uppercase letters. Example: {MAC} → 0080F0C571EB
{mac}	If the URL contains {mac}, it will be replaced with the device's MAC address in lowercase letters. Example: {mac} → 0080f0C571eb
{MODEL}	If the URL contains {MODEL}, it will be replaced with the device's model name. Example: {MODEL} → KX-HDV430

Macro Format {XXXX}	Macro Expansion
{fwver}	If the URL contains {fwver}, it will be replaced with the device's firmware version. Example: {fwver} → 01.000

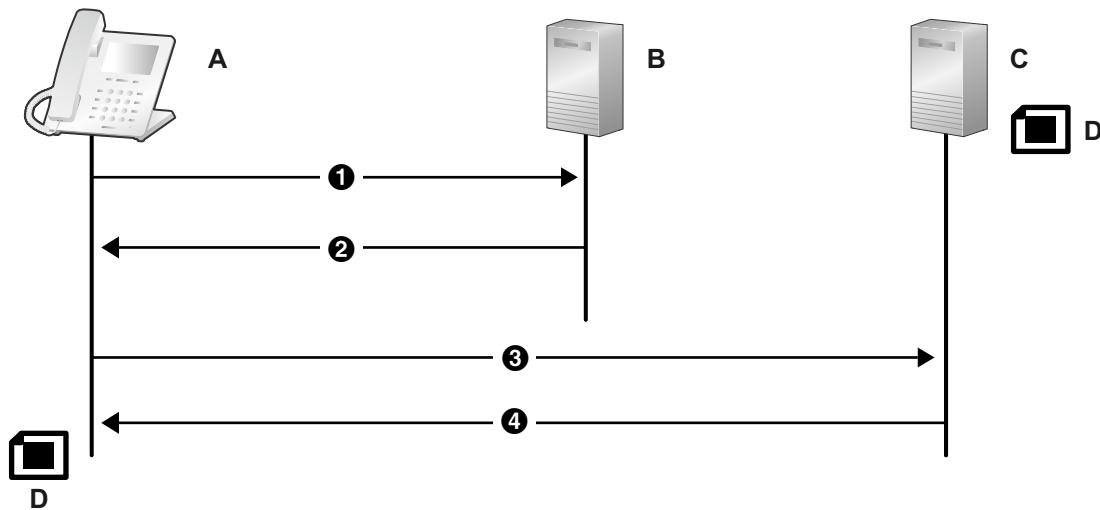

**Note**

- Macros distinguish between uppercase and lowercase letters.
- Macros not specified above will be treated as strings of characters.

## 2.1.4 Obtaining a Provisioning Server Address via SIP PnP

### 1. Basic Sequence

At startup, the phone will multicast a SIP SUBSCRIBE message for the ua-profile event, receive a SIP NOTIFY message from the PnP server and obtain a pre-provisioning server address. It will then obtain a provisioning server address from the pre-provisioning server.

- A. SIP Phone  
 B. PnP Server  
 C. Pre-provisioning Server  
 D. xxxxxxxxxxxx.cfg

- ① SUBSCRIBE (multicast)
- ② NOTIFY (unicast)  
 Body http://server/{MODEL}.cfg
- ③ HTTP GET {MODEL}.cfg
- ④ 200OK

## 2.1.5 Obtaining a Provisioning Server Address from DHCP Options

#### 1. DHCPv4

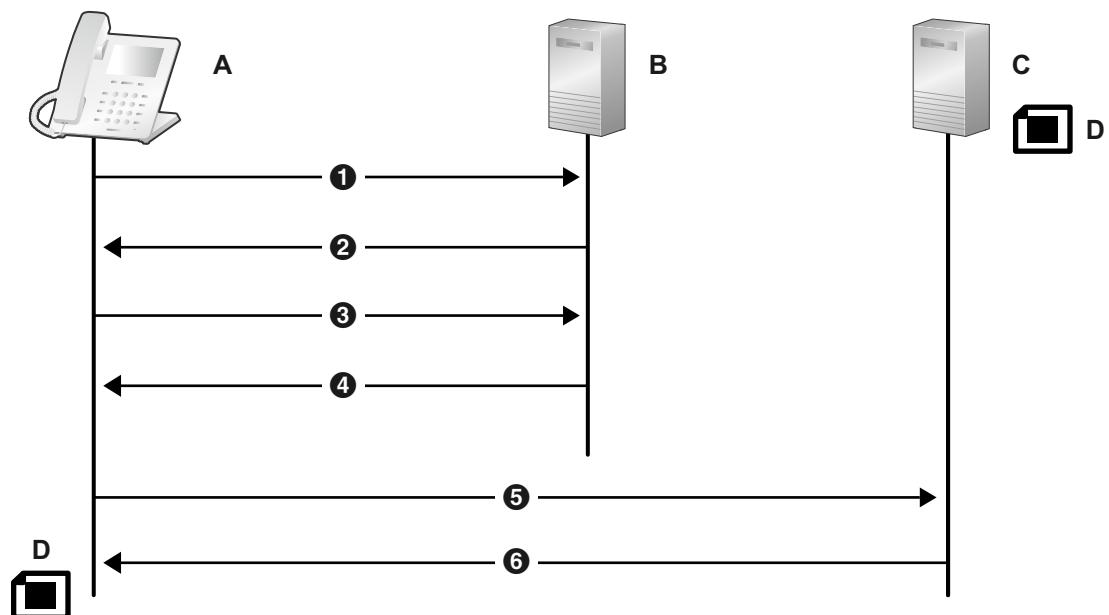

##### a. Basic Sequence

In a DHCPv4 environment, the phone will transmit a DHCP DISCOVER message for DHCP options (66, 67, 159 and 160), receive a DHCP OFFER message, obtain a pre-provisioning server address and obtain a provisioning server address from the pre-provisioning server.

#### Note

- DHCP options (66, 159 and 160) are enabled in the initial state and can be enabled and disabled from the configuration parameters.

DHCP options	Configuration parameter	Priority
Option 66	<b>OPTION66_ENABLE</b>	3
Option 159	<b>OPTION159_PROV_ENABLE</b>	2
Option 160	<b>OPTION160_PROV_ENABLE</b>	1

- A. SIP Phone
- B. DHCP Server
- C. Pre-provisioning Server
- D. KX-HDV430.cfg

- ① DHCP DISCOVER

## 2.2 Provisioning

### 2.2.1 What is Provisioning?

After pre-provisioning has been performed (→ see **2.1 Pre-provisioning**), you can set up the unit automatically by downloading the configuration file stored on the provisioning server into the unit. This is called "provisioning".

### 2.2.2 Protocols for Provisioning

Provisioning can be performed over HTTP, HTTPS, FTP, and TFTP. The protocol you should use differs depending on how you will perform provisioning. Normally, HTTP, HTTPS, or FTP is used for provisioning. If you are transmitting encrypted configuration files, it is recommended that you use HTTP. If you are transmitting unencrypted configuration files, it is recommended that you use HTTPS. You may not be able to use FTP depending on the conditions of the network router or the network to be used.

### 2.2.3 Configuration File

This section gives concrete examples of the functions of the configuration file and how to manage it. The configuration file is a text file that contains the various settings that are necessary for operating the unit. The files are normally stored on a server maintained by your phone system dealer/service provider, and will be downloaded to the units as required. All configurable settings can be specified in the configuration file. You can ignore settings that already have the desired values. Only change parameters as necessary. For details about setting parameters and their descriptions, see **5 Configuration File Programming**.

### Using 3 Types of Configuration Files

The unit can download up to 3 configuration files. One way to take advantage of this is by classifying the configuration files into the following 3 types:

Type	Usage
Master configuration file	Configure settings that are common to all units, such as the SIP server address, and the IP addresses of the DNS and NTP (Network Time Protocol) servers managed by your phone system dealer/service provider. This configuration file is used by all the units.  Example of the configuration file's URL: <a href="http://prov.example.com/Panasonic/ConfigCommon.cfg">http://prov.example.com/Panasonic/ConfigCommon.cfg</a>

Type	Usage
Product configuration file	<p>Configure settings that are required for a particular model, such as the default setting of the privacy mode. This configuration file is used by all the units that have the same model name.</p> <p>The same number of configuration files as models being used on the network are stored on the provisioning server, and units with the same model name download the corresponding configuration file.</p> <p>Example of the configuration file's URL:  <a href="http://prov.example.com/Panasonic/Config{MODEL}.cfg">http://prov.example.com/Panasonic/Config{MODEL}.cfg</a></p> <p><b>Note</b></p> <ul style="list-style-type: none"> <li>When a unit requests the configuration file, "{MODEL}" is replaced by the model name of the unit.</li> </ul>
Standard configuration file	<p>Configure settings that are unique to each unit, such as the phone number, user ID, password, etc.</p> <p>The same number of configuration files as units are stored on the provisioning server, and each unit downloads the corresponding standard configuration file.</p> <p>Example of the configuration file's URL:  <a href="http://prov.example.com/Panasonic/Config{MAC}.cfg">http://prov.example.com/Panasonic/Config{MAC}.cfg</a></p> <p><b>Note</b></p> <ul style="list-style-type: none"> <li>When a unit requests the configuration file, "{MAC}" is replaced by the MAC address of the unit.</li> </ul>

Depending on the situation, you can use all 3 types of configuration files, and can also use only a standard configuration file.

The above example shows only one possible way to use configuration files. Depending on the requirements of your phone system dealer/service provider, there are a number of ways to use configuration files effectively.

## Using 2 Types of Configuration Files

The following table shows an example of using 2 types of configuration files: a master configuration file to configure settings common to all units, and product configuration files to configure settings common to particular groups.

### Using Product Configuration Files According to the Position Groups

You can use product configuration files for different groups or for multiple users within the same group.

Department Name	URL of Product Configuration File
Sales	<a href="http://prov.example.com/Panasonic/ConfigSales.cfg">http://prov.example.com/Panasonic/ConfigSales.cfg</a>
Planning	<a href="http://prov.example.com/Panasonic/ConfigPlanning.cfg">http://prov.example.com/Panasonic/ConfigPlanning.cfg</a>

## 2.2.4 Downloading Configuration Files

### Downloading a Configuration File via the Web User Interface

The following procedure describes how to enable downloading a configuration file via the Web User Interface to be used for programming the unit.

## 2.2.4 Downloading Configuration Files

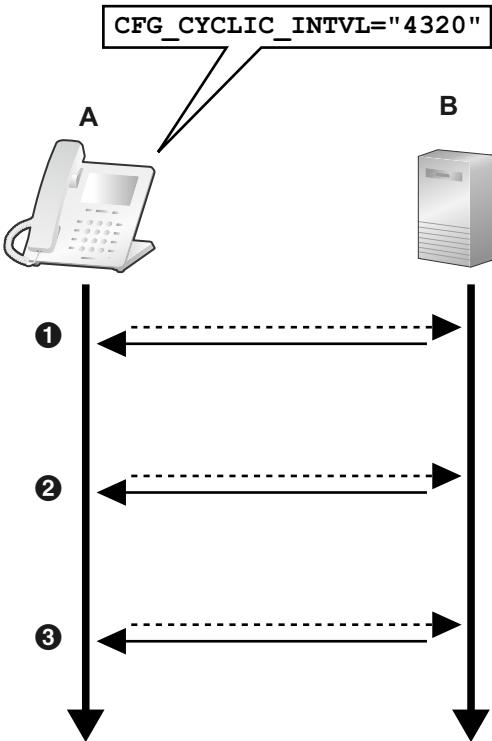

---

1. Confirm that the provisioning server's IP address/FQDN and directory are correct, and store the configuration files in the directory (e.g., [http://provisioning.example.com/Panasonic/Config\\_Sample.cfg](http://provisioning.example.com/Panasonic/Config_Sample.cfg)).
2. Enter the IP address of the unit into the PC's Web browser (→ see **1.1.6.3 Before Accessing the Web User Interface**).
3. Log in as the administrator (→ see **Access Levels (IDs and Passwords)** in **1.1.6.3 Before Accessing the Web User Interface**).
4. Click the **[Maintenance]** tab, and then select **[Provisioning Maintenance]**.
5. Enter the URL set up in Step 1 in **[Standard File URL]**.
6. Click **[Save]**.

### Timing of Downloading

A unit downloads configuration files when it starts up, at regular intervals, and when directed to do so by the server.

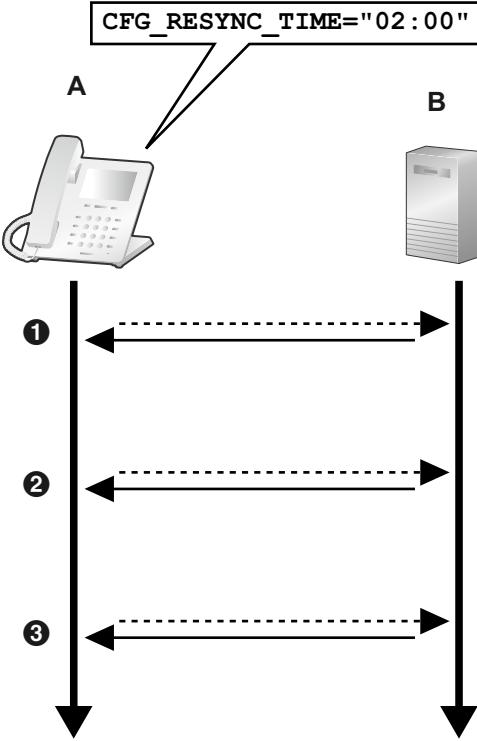

Download Timing	Explanation
Startup	The configuration files are downloaded when the unit starts up.

Download Timing	Explanation
At regular intervals of time	<p>The configuration files are downloaded at specified intervals of time, set in minutes. ## 2.2.5 Provisioning Server Setting Example

This section gives an example of how to set up the units and provisioning server when configuring 2 units with configuration files. The standard configuration files and the master configuration file are used in this example.

### Conditions

Item	Description/Setting
Provisioning server FQDN	prov.example.com
Units' MAC addresses	<ul style="list-style-type: none"><li>• 0080F0111111</li><li>• 0080F0222222</li></ul>
URL of the configuration files	Configure the following 2 settings either by pre-provisioning or through the Web user interface. The values of both settings must be the same. <ul style="list-style-type: none"><li>• CFG_STANDARD_FILE_PATH="http://prov.example.com/Panasonic/Config{MAC}.cfg"</li><li>• CFG_MASTER_FILE_PATH="http://prov.example.com/Panasonic/ConfigCommon.cfg"</li></ul>
Directory on the provisioning server containing the configuration files	Create the "Panasonic" directory just under the HTTP root directory of the provisioning server.
File name of configuration files	Store the following configuration files in the "Panasonic" directory. <ul style="list-style-type: none"><li>• Contains the common settings for the 2 units:<ul style="list-style-type: none"><li>– ConfigCommon.cfg</li></ul></li><li>• Contains the settings unique to each unit:<ul style="list-style-type: none"><li>– Config0080F0111111.cfg</li><li>– Config0080F0222222.cfg</li></ul></li></ul>

To set up the provisioning server

1. Connect the units to the network, and turn them on.
  - a. The unit with the MAC address 0080F0111111 accesses the following URLs:  
<http://prov.example.com/Panasonic/ConfigCommon.cfg>  
<http://prov.example.com/Panasonic/Config0080F0111111.cfg>

- b. The unit with the MAC address 0080F0222222 accesses the following URLs:  
<http://prov.example.com/Panasonic/ConfigCommon.cfg>  
<http://prov.example.com/Panasonic/Config0080F0222222.cfg>

### Example Provisioning Direction from the Server

The following figure shows an example NOTIFY message from the server, directing the units to perform provisioning. The text "check-sync" is specified for "CFG\_RESET\_SYNC\_FROM\_SIP".

## 2.2.6 Encryption

### Secure Provisioning Methods

In order to perform provisioning securely, there are 2 methods for transferring configuration files securely between the unit and the server.

Which method is used depends on the environment and equipment available from the phone system.

#### Method 1: Transferring Encrypted Configuration Files

- A. Unencrypted configuration file
- B. Encrypted configuration file

To use this method, an encryption key is required to encrypt and decrypt the configuration files. A preset encryption key unique to each unit, an encryption key set by your phone system dealer/service provider, etc., is used for the encryption. When the unit downloads an encrypted configuration file, it will decrypt the file using the same encryption key, and then configure the settings automatically.

#### Method 2: Transferring Configuration Files Using HTTPS

This method uses SSL, which is commonly used on the Internet, to transfer configuration files between the unit and server. For more secure communication, you can use a root certificate.

### Notice

- To avoid redundant data transfer over the network, important data, such as the encryption key used to encrypt the configuration files and the root certificate for SSL, should be configured through pre-provisioning as much as possible.

## 2.3 Priority of Setting Methods

- It is recommended that you encrypt the data in order to keep the communication secure when transferring configuration files.  
However, if you are using the units within a secure environment, such as within an intranet, it is not necessary to encrypt the data.

To decrypt configuration files, the unit uses the encryption key registered to it beforehand. The unit determines the encryption status by checking the extension of the downloaded configuration file.

For details about encrypting configuration files, contact the appropriate person in your organization.

Extension of Configuration File	Configuration File Parameters Used for Decrypting
".e2c"	CFG_FILE_KEY2
".e3c"	CFG_FILE_KEY3
Other than ".e2c", and ".e3c"	Processed as unencrypted configuration files. The extension ".cfg" should be used for unencrypted configuration files.

### Comparison of the 2 Methods

The following table compares the characteristics for the 2 transfer methods.

	Transferring Encrypted Configuration Files	Transferring Configuration Files Using HTTPS
Provisioning server load	Light	Heavy (The server encrypts data for each transmission.)
Operation load	Necessary to encrypt data beforehand.	Unnecessary to encrypt data beforehand.
Management of configuration files	Files must be decrypted and re-encrypted for maintenance.	It is easy to manage files because they are not encrypted on the server.
Security of data on the server when operating	High	Low (Configuration files are readable by anyone with access to the server.)

Moreover, there is another method: configuration files are not encrypted while stored on the server, and then, using the encryption key registered to the unit beforehand, they are encrypted when they are transferred. This method is particularly useful when several units are configured to download a common configuration file using different encryption keys. However, as when downloading an unencrypted configuration file using HTTPS, the server will be heavily burdened when transferring configuration files.

## 2.3 Priority of Setting Methods

The same settings can be configured by different configuration methods: provisioning, Web user interface programming, etc. This section explains which value is applied when the same setting is specified by multiple methods.

The following table shows the priority with which settings from each method are applied (lower numbers indicate higher priority):

Priority	Setting Method
3	The factory default settings for the unit
2	Pre-provisioning with the configuration file

Priority	Setting Method	
1	1-1	Provisioning with the standard configuration file
	1-2	Provisioning with the product configuration file
	1-3	Provisioning with the master configuration file
	Settings configured from the Web user interface or the phone user interface	

According to the table, settings configured later override previous settings (i.e., settings listed lower in the table have a higher priority).

### Notice

- Make sure to perform Reset to Factory Default before connecting the unit to a different phone system. Contact your phone system dealer/service provider for further information.

## 2.4 Configuration File Specifications

The specifications of the configuration files are as follows:

### File Format

The configuration file is in plain text format.

### Lines in Configuration Files

A configuration file consists of a sequence of lines, with the following conditions:

- Each line must end with "<CR><LF>".

### Note

<CR> or <LF> alone may be acceptable under certain conditions.

- Lines that begin with "#" are considered comments.
- Configuration files must start with a comment line containing the following designated character sequence (44 bytes):
 

```
# Panasonic SIP Phone Standard Format File #
```

The hexadecimal notation of this sequence is:  
 23 20 50 61 6E 61 73 6F 6E 69 63 20 53 49 50 20  
 50 68 6F 6E 65 20 53 74 61 6E 64 61 72 64 20 46  
 6F 72 6D 61 74 20 46 69 6C 65 20 23

- To prevent the designated character sequence being altered by chance, it is recommended that the configuration file starts with the comment line shown below:
 

```
# Panasonic SIP Phone Standard Format File # DO NOT CHANGE THIS LINE!
```
- Configuration files must end with an empty line.
- Each parameter line is written in the form of XXX="yyy" (XXX: parameter name, yyy: parameter value). The value must be enclosed by double quotation marks.
- A parameter line written over multiple lines is not allowed. It will cause an error on the configuration file, resulting in invalid provisioning.

### Configuration Parameters

- The unit supports multiple telephone lines. For some parameters, the value for each line must be specified independently. A parameter name with the suffix "\_1" is the parameter for line 1; "\_2" for line 2; ...; "\_16" for line 16, and so on.

Examples of setting the line (phone number) for accessing a voice mail server:

## 2.4 Configuration File Specifications

---

"VM\_NUMBER\_1": for line 1,  
"VM\_NUMBER\_2": for line 2, ...  
"VM\_NUMBER\_16": for line 16

### Note

- The number of lines available varies depending on the phone being used, as follows:
  - KX-HDV430: 1–16
- Some parameter values can be specified as "empty" to set the parameter values to empty.  
Example:  
`NTP_ADDR=""`
- The parameters have no order.
- If the same parameter is specified in a configuration file more than once, the value specified first is applied.
- All configurable settings can be specified in the configuration file. You can ignore settings that already have the desired values. Only change parameters as necessary.
- Boolean parameters (BOOLEAN) accept all of the following configurations.  
"Y": "Y", "y", "Yes", "YES", "yes"  
"N": "N", "n", "No", "NO", "no"

### Parameter Extensions

You can use parameter extensions to specify parameters as Read-Only or Carrier Default.

#### Read-Only Specification

- When "?R" or "?r" is specified, the phone user interface and Web user interface for the parameter in question is restricted to Read-Only.
  - \* Restricting the phone user interface to Read-Only  
The Read-Only parameter settings menu appears, but an error occurs during registration.
  - \* Restricting the Web user interface to Read-Only  
The Read-Only parameter settings menu appears grayed out and nothing can be entered.

### Note

- Parameters that can be configured from the device and from the Web can be confirmed from footnotes 1-3 on the parameter names in "5.1 Configuration File Parameter List".
- When "?R" or "?r" is not specified, the phone user interface and Web user interface are both readable and writable.
  - \* Optional specifications for "?R" and "?r" are enabled when the last parameter in question is configured.  
Example:  
(1) Import XXX?R="111" from the Web as a standard file.
    - XXX: Read-Only
    - XXX operational information: 111
  - (2) Import XXX="222" from the Web as a product file.
    - XXX : Read/Write
    - XXX operational information: 222
- \* When configurations in (1) and (2) are used, the higher priority standard file will be enabled and the value for XXX in Read-Only mode will be 111.

#### Carrier Default Specification

- When "?!" is specified, applicable parameter values are managed as carrier default values when applied to operational information.
  - \* Carrier default values are applied once a reset to carrier defaults is executed. Carrier defaults will also be initialized when a reset to device defaults is executed.
  - \* Once "?!" is specified, the parameter in question will be designated as a carrier default even if said parameter is configured without "?!". (This setting will remain in place until restored to factory default.)

#### Specification of Multiple Parameter Extensions

- One parameter can be assigned multiple extensions.  
Example: XXX?R?!" / XXX?!"?r=""

#### Parameter Extension Configuration Example

1. In the configuration file, set IP Addressing Mode to IPv4 and Read-Only  
Example parameter: IP\_ADDR\_MODE?R="0" ("0": IPv4)
2. If an error occurs when attempting to set the IP Mode to IPv6, see **To configure IP Mode (IPv4, IPv6, IPv4&IPv6)** in Configuring the Network Settings of the Unit.

## 2.5 Configuration File Examples

## 2.5.2 Example with Incorrect Descriptions

The following listing shows an example of a configuration file that contains incorrect formatting:

- ② Comment lines start in the middle of the lines.

### Incorrect Example

```
# This is a simplified sample configuration file. —①
#####
# Configuration Setting #
#####

CFG_STANDARD_FILE_PATH="http://config.example.com/0123456789AB.cfg"
# URL of this configuration file

#####
# SIP Settings #
# Suffix "_1" indicates this parameter is for "line 1". #
#####

## 4.3 Network

This section provides detailed descriptions about all the settings classified under the **[Network]** tab.

### 4.3.1 Basic Network Settings

This screen allows you to change basic network settings such as whether to use a DHCP server, and the IP address of the unit.

#### Note

- Changes to the settings on this screen are applied when the message "Complete" appears after clicking **[Save]**. Because the IP address of the unit will probably be changed if you change these settings, you will not be able to continue using the Web user interface. To continue configuring the unit from the Web user interface, log in to the Web user interface again after confirming the newly assigned IP address of the unit using the phone user interface. In addition, if the IP address of the PC from which you try to access the Web user interface has been changed, close the Web port once by selecting "Off" for "Embedded Web" on the unit (→ see **Opening/Closing the Web Port** in **1.1.6.3 Before Accessing the Web User Interface**).

# 5.2 General Information on the Configuration Files

## 5.2.1 Configuration File Parameters

The information on each parameter that can be written in a configuration file is shown in the tables below. The information includes parameter name (as the title of the table), value format, description, permitted value range, default value of each parameter, phone user interface reference, and Web user interface reference.

### Parameter Name

This is the system-predefined parameter name and cannot be changed.

### Note

- Certain parameter names end with ".n". This signifies that these settings can be made to each line individually. The number of lines available varies depending on the phone being used, as follows:
  - KX-HDV430: 1–16

### Value Format

Each parameter value is categorized into Integer, Boolean, or String. Some parameters require a composite form such as "Comma-separated Integer" or "Comma-separated String".

- **Integer:** a numerical value, described as a sequence of numerical characters, optionally preceded by a "-" (minus)  
An empty string is not allowed.

- **Boolean:** "Y" or "N"
- **String:** sequence of alphanumerical characters  
For details about available characters, see **5.2.2 Characters Available for String Values**.
- **Comma-separated Integer:** a list of integers, separated by commas  
No space characters are allowed.
- **Comma-separated String:** a list of strings, separated by commas  
No space characters are allowed.
- **IPADDR:** IPv4 address format.
- **IPADDR-V6:** IPv6 address format (can be abbreviated).

### Description

Describes the details of the parameter.

### Value Range

Indicates the permitted value range of the parameter.

### Default Value

Indicates the factory default value of the parameter.

Actual default values may vary depending on your phone system dealer/service provider.

### Phone User Interface Reference

Provides the reference page of the corresponding parameter in phone user interface programming.

### Web User Interface Reference

Provides the reference page of the corresponding parameter in Web user interface programming.

## 5.2.2 Characters Available for String Values

Unless noted otherwise in "Value Range", only ASCII characters can be used for parameter values. Unicode characters can also be used in some parameter values.

Available ASCII characters are shown on a white background in the following table:

## **Section 6**

### ***Useful Telephone Functions***

*This section explains phone number settings, dial plan settings, the phonebook import/export function, the Broadsoft XSI function, the BroadCloud (Presence) function and Pairing (Parallel Mode).*

## 6.1 Phonebook Import and Export

This section explains how to import and export phonebook data. Phonebook data of the unit includes names and phone numbers.

Phonebook data on the unit can be exported, edited with editor tools, and imported again. In addition, phonebook data created with other software can be imported into the unit.

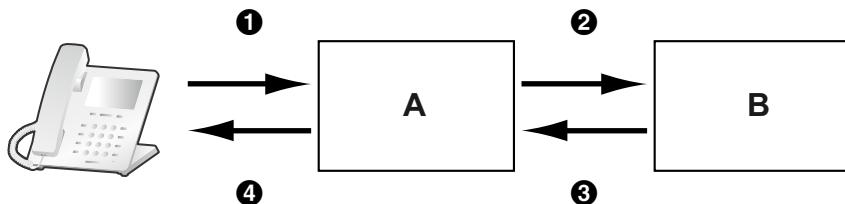

You can use the phonebook import and export functions as follows.

- A. Phonebook data
- B. Microsoft Excel
- C. Microsoft Outlook

### Editing Phonebook Data on a PC

The phonebook data stored on the unit can be edited using a program such as Microsoft Excel® spreadsheet software. For details about the operation, see **6.1.2 Editing with Microsoft Excel**.

You can export the phonebook data to the PC, edit the exported file using appropriate software, and then import it into the unit.

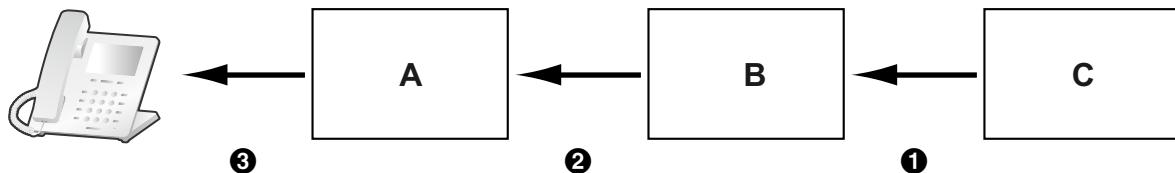

### Importing Address Book Data from a PC

You can import address book data stored in programs, such as Microsoft Outlook® messaging and collaboration client, into the unit.

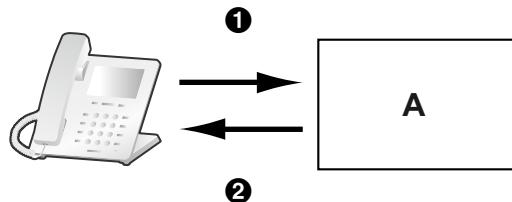

First, export address book data from the e-mail software to a program such as Microsoft Excel, edit it as necessary, and then import the exported data into the unit.

For details about the operation, see **6.1.3 Exporting Data from Microsoft Outlook**.

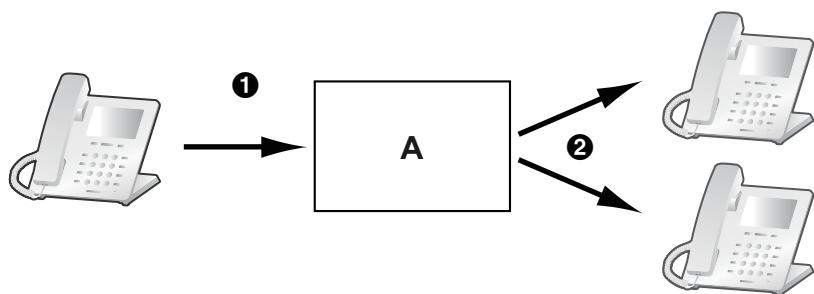

### Backing up Phonebook Data

You can export the phonebook data from the unit to a PC and keep the file as a backup in case of data loss or for use when exchanging the unit.

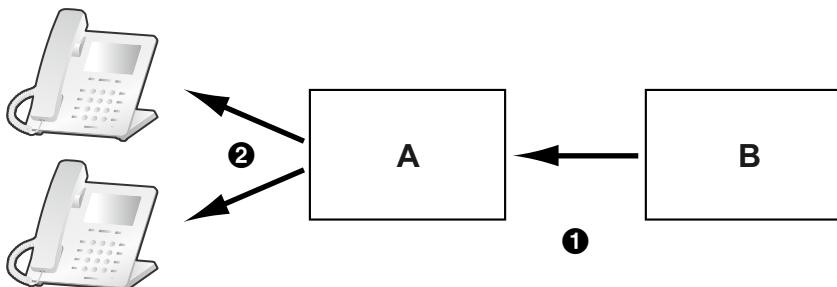

### Importing the Same Phonebook Data to other Units

You can export the phonebook data created on a unit to a PC, and then import it into other units.

You can also import phonebook data created on a PC to other units.

## Import/Export File Format

The file format used for importing and exporting the phonebook data is "TSV". When importing or exporting using Microsoft Excel, "CSV (Comma-separated Value)" is generally used as the file format.

A phonebook entry in the unit has 9 fields. An entry in the phonebook data is represented in text as "record ID <TAB> name <TAB> reserved <TAB> phone number <TAB> reserved <line break>".

The text data can be edited using any text editing software that supports UTF-16 encoding with a BOM and little endian byte ordering. When you save the text file, it must be saved using the same format, or the text might become garbled.

## 6.1.1 Import/Export Operation

The following procedures explain how to import phonebook data to units, and how to export phonebook data from units to a PC through the Web user interface.

For details about the settings, see **4.6.6 Import Phonebook** or **4.6.7 Export Phonebook**.

### To import phonebook data

1. Click the [Telephone] tab, and then click [**Import Phonebook**].
2. In [**File Name**], enter the full path to the file that you want to import, or click **Browse** to select the phonebook data file that you want to import.
3. Click [**Import**].

### To export the phonebook data

1. Click the [Telephone] tab, and then click [**Export Phonebook**].
2. Click [**Export**].
3. On the "Now Processing File Data" screen, click the text "HERE" in the displayed message, or wait until **File Download** window appears.

### Note

- Depending on the security settings of your Web browser, pop-up menus might be blocked. If the file cannot be exported successfully, try the export operation again or change the security settings of your Web browser.
4. Click **Save on File** Download window.
  5. On the **Save As** window, select a folder to save the exported phonebook data to, enter the file name in **File name**, select **TSV File** for **Save as type**, and click **Save**.  
If the file is downloaded successfully, the **Download complete** window appears.
  6. Click **Close**.
  7. To exit the operation, click the text "HERE" in the displayed message.  
The **[Export Phonebook]** screen returns.

### Note

- Make sure that the import source or unit is in standby mode.
- The import source or unit must be specified at the time of import/export. The imported data is added to the existing phonebook data.
  - If the existing phonebook data has an entry with the same record ID as an imported entry, the entry is overwritten with the imported entry.
  - If the existing phonebook data has an entry with no record ID, it will be left in the phonebook.
  - If the imported phonebook data has an entry with no record ID, the imported entry is added as a new entry unless an existing entry with the same name and phone number is found.

Phonebook entries that are added via the unit are not assigned record IDs. Therefore, it is recommended to export phonebook data from the unit, assign record IDs manually and then re-import them. Doing so can help manage phonebook data.
- The phonebook for a unit has the following limitations:
  - A maximum of 500 phonebook entries can be stored in the unit. If the unit already has phonebook data, it accepts up to the 500th entry, including the existing entries.
  - The name can contain up to 24 characters.
  - The phone number can contain up to 32 digits.
  - Phonebook entries exceeding the characters or digits limits cannot be imported properly.
- If the export is interrupted by an operation on the unit, only the data that has been successfully exported before the interruption is exported to a file.

## 6.1.2 Editing with Microsoft Excel

You can edit exported phonebook data on a PC with software such as Microsoft Excel. You can then import the phonebook data into units.

### To open the phonebook data on a PC

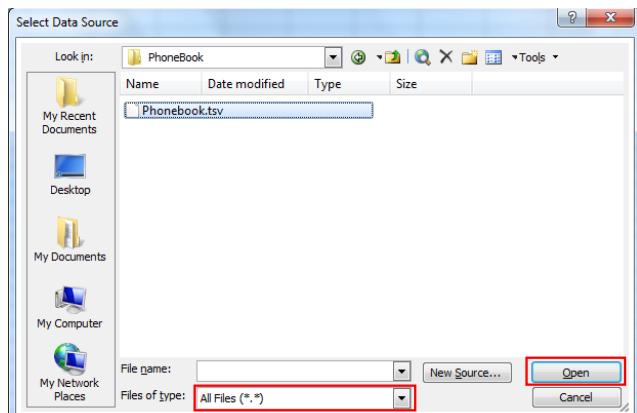

1. Open Microsoft Excel.
2. Click **Office Button**, and then **Open**.

### Note

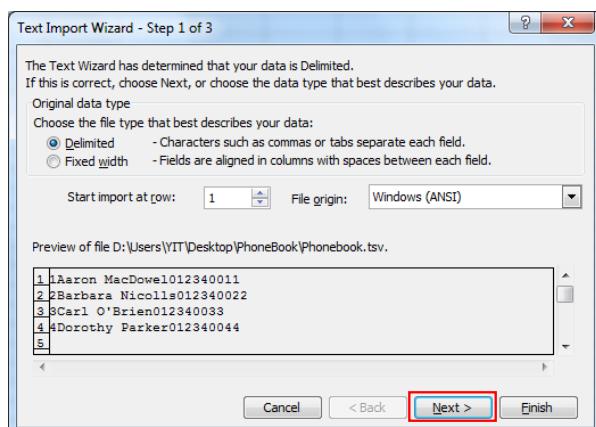

- Make sure to open a TSV file in this procedure. If you change the extension of a TSV file to ".csv", the file will open by simply double-clicking it. However, the character encoding of the file might not be recognized properly, resulting in garbled characters, or the phone numbers might be recognized as numbers, resulting in data alteration.

## 6.1.2 Editing with Microsoft Excel

3. Select **All Files** for the file type, select the exported phonebook data file, and click **Open**.

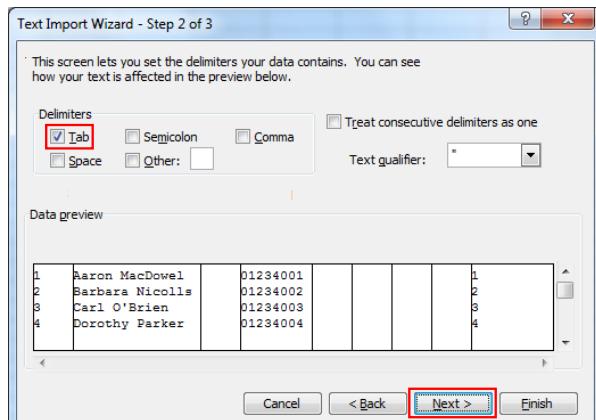

4. On the **Text Import Wizard - Step 1 of 3** window, click **Next**.

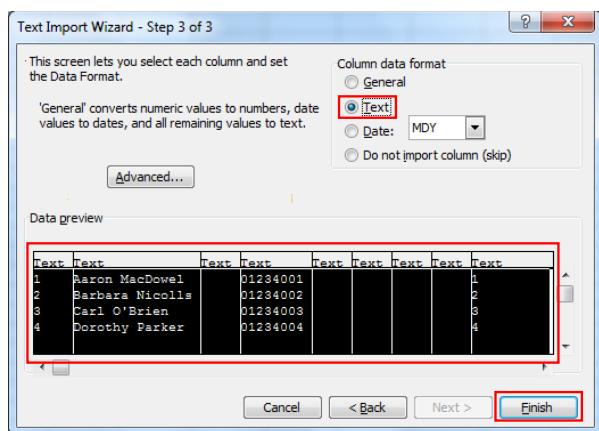

### Note

- Regardless of what is selected for **File origin**, the file will be processed normally if the format is appropriate.

5. On the **Text Import Wizard - Step 2 of 3** window, select **Tab** for **Delimiters**, and then click **Next**.

6. On the **Text Import Wizard - Step 3 of 3** window, select all columns in **Data preview**, select **Text** in **Column data format**, and then click **Finish**.  
The TSV file will be opened.

### Note

- Phone numbers must be treated as text strings. Otherwise, a "0" at the beginning of a phone number might disappear when exported.

#### To save the phonebook data for importing to the unit

1. After editing the phonebook entries, click **Office Button**, and then **Save As**.
2. Enter a file name in **File name**, and select **Unicode Text in Save as type**.  
The file will be saved in UTF-16 little endian with a BOM. Fields will be separated by tabs.
3. Click **Save**.  
A message warning you about file compatibility will be displayed.
4. Click **Yes**.  
The file will be saved as a Unicode text file, with the fields separated by tabs.

### Note

- The procedure may vary depending on the software version of Microsoft Excel. Therefore, files exported and imported between the unit and Microsoft Excel are not always compatible with each other.

## 6.1.3 Exporting Data from Microsoft Outlook

3. Select **Tab Separated Values (Windows)**, and click **Next**.
4. Select **Contacts**, and click **Next**.
5. Click **Browse**, select a folder, and then enter the file name to export the data to.
6. Click **OK**.
7. On the **Export to a File** window, click **Next**.

8. Click **Map Custom Fields**.
9. Clear all items in the **To** list by clicking **Clear Map**. Then, drag only **Last Name** and **Business Phone** from the **From** list to the **To** list, and click **OK**.
10. On the **Export to a File** window, click **Finish**.  
The data will be exported.

### Note

- You can export data from Microsoft Outlook Express by using a similar procedure. It is also possible to export data from other applications that are compatible with Microsoft Excel.
- You can open the exported file in Microsoft Excel, and then import it to the unit. For details, see **6.1.2 Editing with Microsoft Excel**.
- First and middle names are not exported using this procedure. You can export all necessary items and edit the entry before importing them to the unit.
- In the file exported from Microsoft Outlook, fields are separated by tabs and encoded using the default character encoding for your operating system.

## 6.2 Dial Plan

The dial plan settings control how numbers dialed by the user are transmitted over the network. Dial plan settings can be configured on a per-line basis. These settings can be programmed either through the Web user interface (→ see **4.6.2.2 Dial Plan**) or by configuration file programming (→ see **5.3.34 Call Control Settings**).

### 6.2.1 Dial Plan Settings

#### To set Dial Plan

1. In the Web user interface, click the **[Telephone]** tab, and then click **[Call Control [Line 1]–[Line x]]**.
2. In **[Dial Plan]**, enter the desired dial format.  
The dial plan settings can be configured for each line separately.  
For details about available characters for the dial format, see **Available Values for the Dial Plan Field** in this section.
3. Select **[Yes]** or **[No]** for **[Call Even If Dial Plan Does Not Match]**.
  - If you select **[Yes]**, the call will be made even if the user dials a phone number that does not match the dial format in **[Dial Plan]**.
  - If you select **[No]**, the call will be made only if the user dials a phone number that matches the dial format in **[Dial Plan]**.

#### Note

- For details about configuring these settings by configuration file programming, see "**DIAL\_PLAN\_n**" and "**DIAL\_PLAN\_NOT\_MATCH\_ENABLE\_n**" in **5.3.34 Call Control Settings**.

### Available Values for the Dial Plan Field

The following table explains which characters you can use in the dial format, and what the characters mean.

Element	Available Value	Description
String	0–9, [ , - , ] , < , : , > , * , # , ! , S , s , T , t , X , x , . ,   , +	You can enter dial plan descriptions using a combination of the characters listed as available values.

Element	Available Value	Description
Digit	0–9, *, #, +	<b>Example:</b> "123" If the dialed phone number is "123", the call is made immediately.
Wildcard	X, x	<b>Example:</b> "12xxxxx" If the dialed phone number is "12" followed by any 5-digit number, the call is made immediately.
Range	[]	<b>Example:</b> "[123]" If the dialed phone number is either one of "1", "2", or "3", the call is made immediately.
Subrange	-	<b>Example:</b> "[1-5]" If the dialed phone number is "1", "2", "3", "4", or "5", the call is made immediately. <ul style="list-style-type: none"> <li>• A subrange is only valid for single-digit numbers. For example, "[4-9]" is valid, but "[12-21]" is invalid.</li> </ul>
Repeat	.	<b>Example:</b> "1." If the dialed phone number is "1" followed by zero or more "1"s (e.g., "11", "111"), the call is made.
Substitution	<(before):(after)>	<b>Example:</b> "<101:9999>" If the dialed phone number is "101", "101" is replaced by "9999", and then the call is made immediately.
Timer	S, s (second)	<b>Example:</b> "1x.S2" If the dialed phone number begins with "1", the call is made after a lapse of 2 seconds. <ul style="list-style-type: none"> <li>• The number (0–9) followed by "S" or "s" shows the duration in seconds until the call is made.</li> </ul>
Macro Timer	T, t	<b>Example:</b> "1x.T" If the dialed phone number begins with "1", the call is made after a lapse of "T" seconds. <ul style="list-style-type: none"> <li>• The value of "T" or "t" can be configured through the Web user interface (→ see <b>[Timer for Dial Plan]</b> in <b>4.6.1.1 Call Control</b>).</li> </ul>
Reject	!	<b>Example:</b> "123xxx!" If the dialed phone number is "123" followed by 3 digits, the call is not made.
Alternation		<b>Example:</b> "1xxxx 2xxx" If the dialed phone number is "1" followed by 4 digits, or "2" followed by 3 digits, the call is made immediately. You can use this element to specify multiple numbers.
Comma	,	Example: "9,xxxxxxxxxx.T" If 9 is dialed, the second dial tone is heard, and then 11 digits are dialed, the call is made after waiting "T" seconds. * The dialing will include the initially dialed "9".

**Note**

- You can enter up to 1000 characters in **[Dial Plan]**.

## 6.2.1 Dial Plan Settings

---

- You can assign up to 100 dial plans separated by "|" in [Dial Plan].
- You can assign up to 32 digits per dial plan in [Dial Plan].
- You can assign up to 10 substitutions in [Dial Plan].
- After the user completes dialing, the unit immediately sends all the dialed digits if [Call Even If Dial Plan Does Not Match] is set to [Yes] in the Web user interface or if "DIAL\_PLAN\_NOT\_MATCH\_ENABLE\_n" is set to "n" in a configuration file. The unit recognizes the end of dialing as follows:
  - The inter-digit timer expires (→ see [Inter-digit Timeout] in 4.6.1.1 Call Control in the Web user interface or "INTDIGIT\_TIM" in 5.3.30 Telephone Settings in the configuration file).
  - The user presses [ENTER] or the # key.
  - The call is initiated after going off-hook (pre-dial).

### Dial Plan Example

The following example shows dial plans containing character sequences separated by "|".

Example: "[2346789]11|01[2-9]x.|[2-9]xxxxxxxx"

#### Complete Match:

Example: "[2346789]11|01[2-9]x.|[2-9]xxxxxxxx"

- If the dialed phone number is "211", "911" and so on, the call is made immediately.

Example: "[2346789]11|01[2-9]x.|[2-9]xxxxxxxx"

- If the dialed phone number is "2123456789", "5987654321" and so on, the call is made immediately.

#### Partial Match (when the dial plan contains "."):

Example: "[2346789]11|01[2-9]x.|[2-9]xxxxxxxx"

- If the dialed phone number is "01254", "012556" and so on, the call is made after the inter-digit timer expires.

#### Partial Match (when the dial plan does not contain "."):

Example: "[2346789]11|01[2-9]x.|[2-9]xxxxxxxx"

- If the dialed phone number is "21", "91" and so on when [Call Even If Dial Plan Does Not Match] is set to [Yes], the call is made after the inter-digit timer expires.
- If the dialed phone number is "21", "91" and so on when [Call Even If Dial Plan Does Not Match] is set to [No], the call is denied after the inter-digit timer expires.

Example: "[2346789]11|01[2-9]x.|[2-9]xxxxxxxx"

- If the dialed phone number is "21234567", "598765432" and so on when [Call Even If Dial Plan Does Not Match] is set to [Yes], the call is made after the inter-digit timer expires.
- If the dialed phone number is "21234567", "598765432" and so on when [Call Even If Dial Plan Does Not Match] is set to [No], the call is denied after the inter-digit timer expires.

#### No Match:

Example: "[2346789]11|01[2-9]x.|[2-9]xxxxxxxx"

- If the dialed phone number is "0011", "1011" and so on when [Call Even If Dial Plan Does Not Match] is set to [Yes], the call is made after the inter-digit timer expires.
- If the dialed phone number is "0011", "1011" and so on when [Call Even If Dial Plan Does Not Match] is set to [No], the call is denied.

## 6.3 Flexible Keys

## 6.4 Broadsoft XSI (Xtended Services Interface)

### 6.4.1 Outline

BroadWorksXsi is an API library used to support the integration of Internet service-based BroadWorks functionality to create web applications and mashups (web application hybrids).

This product uses the Broadsoft XSI (Xtended Services Interface) to run the following services.

1. Remote Office
2. AnyWhere
3. Simultaneous Ring Personal
4. Calling Line ID Delivery Blocking (Anonymous Call)
5. Call Forward
6. Do Not Disturb
7. Anonymous Call Rejection

#### (1) Remote Office

The Remote Office function allows you to use your home phone or cellular phone as your office phone. All incoming calls are forwarded from the IP phone to the Remote Office phone number.

#### 6.4.2 XSI Service Settings

---

##### (2) AnyWhere

The AnyWhere function is for remote users to easily access their IP phone's functions (such as making and receiving calls, and voicemail) from any phone.

##### (3) Simultaneous Ring Personal

The Simultaneous Ring Personal function enables up to 10 other phone numbers to ring at the same time an IP phone receives a call.

##### (4) Calling Line ID Delivery Blocking (Anonymous Call)

The Calling Line ID Delivery Blocking (Anonymous Call) function sets the caller information for calls made from an IP phone to "Anonymous Call".

##### (5) Call Forward

The Call Forward function forwards incoming calls to an IP phone to a specified phone number.

\* When Feature Key Synchronization is set (FWD\_DND\_SYNCHRO\_ENABLE\_n="Y", see page 290), the Call Forward function will not operate as an XSI function.

##### (6) Do Not Disturb

The Do Not Disturb function rejects incoming calls to the IP phone.

\* When Feature Key Synchronization is set (FWD\_DND\_SYNCHRO\_ENABLE\_n="Y", see page 290), the Do Not Disturb function will not operate as an XSI function.

##### (7) Anonymous Call Rejection

The Anonymous Call Rejection function rejects calls made to the IP phone as Anonymous Calls.

## **Section 7**

### **Firmware Update**

*This section explains how to update the firmware of the unit.*

## 7.1 Firmware Server Setup

No special server is necessary for the firmware update. You can use an HTTP, HTTPS, FTP, or TFTP server as the firmware server by simply setting its URL.

### Note

- It is recommended to select a time for updating in which the unit will not be used. (For details about the timing of updating configuration files, see **2.2.4 Downloading Configuration Files**.)

## 7.2 Firmware Update Settings

Firmware updates are provided by the manufacturer when necessary.

The firmware update will be executed by setting the corresponding parameters using configuration file programming (→ see **5.3.6 Firmware Update Settings**) or Web user interface programming (→ see **4.7.2 Firmware Maintenance**). The following shows the parameters and the setting procedures:

### Firmware Update Enable/Disable

- In a configuration file, add the line, `FIRM_UPGRADE_ENABLE="Y"`.
- In the Web user interface, click the **[Maintenance]** tab, click **[Firmware Maintenance]**, and then select **[Yes]** for **[Enable Firmware Update]**.

### Firmware Version Number

- In a configuration file, specify the new version number in `"FIRM_VERSION"`.

### Firmware Server URL

- In a configuration file, specify the URL in `"FIRM_FILE_PATH"`.
- In the Web user interface, click the **[Maintenance]** tab, click **[Firmware Maintenance]**, and then enter the URL in **[Firmware File URL]**.

### Configuration Parameter Example

By setting the parameters as shown in the following example, the unit will automatically download the firmware file from the specified URL, "http://firm.example.com/firm/01.050.fw", and perform the update operation if the currently used firmware version is older than 01.050.

### Example

```
FIRM_UPGRADE_ENABLE="Y"  
FIRM_VERSION="01.050"  
FIRM_FILE_PATH="http://firm.example.com/firm/01.050.fw"
```

## 7.3 Executing Firmware Update

After configuring the firmware update settings in the configuration file, the firmware will be updated when the configuration file is downloaded. The firmware update procedure is detailed below.

### The firmware update process

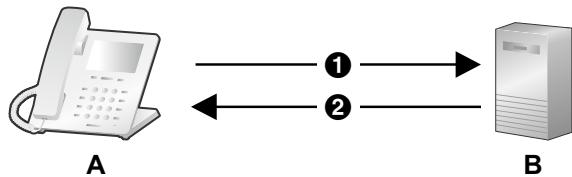

### Note

- Downgrading the firmware is not recommended. Operation cannot be guaranteed after performing a downgrade.

**Step 1**

The unit downloads a configuration file from the provisioning server.

- For details about setting the timing of when configuration files are downloaded, see [2.2.4 Downloading Configuration Files](#).

① Provisioning Server Address

② Configuration File

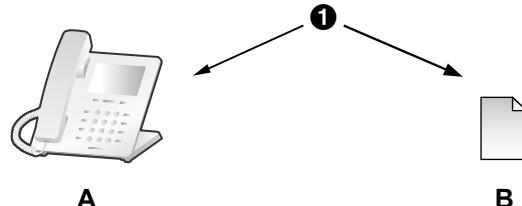

A. SIP Phone

B. Provisioning Server

**Step 2**

The unit compares the version number of the firmware in the configuration file to the unit's current firmware version.

(In this example, the unit is using version 01.000 and the configuration file specifies version 01.050.)

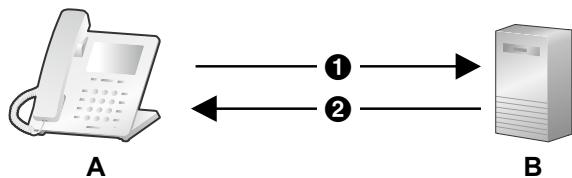

① Compare

A. SIP Phone  
Current Version 01.000

B. Provisioned Configuration File  
FIRM\_VERSION="01.050"

**Step 3**

When a newer firmware version is specified in the configuration file, the unit will download the firmware from the address specified under "**FIRM\_FILE\_PATH**" in the configuration file.

① http://firm.example.com/firm/01.050.fw

② 01.050.fw

A. SIP Phone

B. Firmware Server

Version 01.050 Updated

## **Section 8**

### **Troubleshooting**

*This section provides information about troubleshooting.*

## 8.1 Troubleshooting

If you still have difficulties after following the instructions in this section, disconnect the unit from the AC outlet, then connect the AC adaptor again. If using PoE, disconnect the LAN cable, then connect the LAN cable again.

### General Use

Problem	Cause/Solution
The display is blank.	<p>The unit is not designed to function when there is a power failure. Make sure that the device supplying PoE is receiving power and that the Ethernet cable is properly connected.</p> <p>(If you are using a PoE hub, the number of devices that you can connect simultaneously is limited by the amount of power supplied by the hub.)</p> <p>If an AC adaptor is connected, confirm that the AC adaptor is connected and receiving power.</p>
I cannot hear a dial tone.	<ul style="list-style-type: none"><li>Network settings may not be correct.</li><li>Many installation issues can be resolved by resetting all the equipment. First, shut down your modem, router, hub, unit, and PC. Then turn the devices back on, one at a time, in this order: modem, router, hub, unit, PC.</li><li>If you cannot access Internet Web pages using your PC, check to see if your phone system is having connection issues in your area.</li><li>Check the VoIP status in the Web user interface and confirm that each line is registered properly (→ see <b>To check the setting status in the Web user interface</b> in this section).</li><li>Check that the SIP server address, URLs of the configuration files, encryption key, and other required settings are correct.</li><li>Check the firewall and port forwarding settings on the router.</li><li>For details about the settings, consult your network administrator or phone system dealer.</li></ul>

## Making/Answering Calls, Intercom
